US-PAT NO: 5890429

DOCUMENT-IDENTIFIER: US 5890429 A

TITLE: Method of making and bonding a screen printed ink film carrier to an electronic device

DATE-ISSUED: April 6, 1999

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Alam; Shahriar	Chandler	AZ	N/A	N/A

Valle; Michael J.	Mesa	AZ	N/A	N/A

US-CL-CURRENT: 101/129; 156/240, 156/277, 156/307.1

ABSTRACT:

Screen ink printed film carrier having an ink screen printed electrical altering image provided on thin adhesive film carrier that is flexible and capable of deformation out of the major plane of the carrier to conform to the exterior contour presented by flat or complicated three-dimensional objects, upon which the film carrier can be affixed.

ABSTRACTED-PUB-NO: JP59042930A

BASIC-ABSTRACT:

Method comprises (a) laminating a number of prepreg sheets prepd. by impregnating thermosetting resin into substrate sheets and drying the resin; (b) coating the peripheral sides and vicinal portions of laminated sheets with a quickly curable resin and drying to form a protective coating; and (c) hot pressing the laminated sheets. The resin is pref. epoxy resin, phenol resin, unsatd. polyester, melamine resin, polyimide, or polybutadiene or modified resin. The substrate sheet is pref. paper or woven or unwoven cloth or mat of cotton, polyamide, PVA, polyester, polyacrylate, glass or asbestos. The quickly curable resin is pref. phenol resin, epoxy resin, unsatd. polyester, melamine resin, polyurethane, polyimide, alkyd resin, silicone resin, furan resin, allyl resin, acrylic resin, nylon or PVA hardened within 60 min. The coating of peripheral sides and vicinal portions between the upper and lower parts of a press with quickly curable resin prevents draining of impregnated resin from the sheets to improve dimensional stability.

ABSTRACTED-PUB-NO: DE 3923555A

BASIC-ABSTRACT:

Decorative sheet (I) comprises a base sheet with a resin-preimpregnated laminate and a wood-resin composite bonded to opposite sides of it.

(I) is mfd. by producing a flat composite from a mixt. of resin composite paste and wood chips, bonding with using heat and pressure and bonding the laminate obt'd. with a base sheet in a reverse arrangement.

Specifically, (1) contains wood chips dispersed in the resin composite paste, a heat cured unsatd. polyester, polyurethane, diallyl phthalate, epoxy, silicone, phenolic or acrylic resin; paste contains fillers, pref. CaCO₃, talcum, TiO₂, silica or glass powder (pref. amt. 100-400 pts. wt. filler/100g resin); a pigment of the same shade as (3); (3) are solid rectangular chips 3-7mm x 3-20mm x 0.2-3mm, or cylindrical chips of dia. 5-100mm and 0.2-5 mm thick, or randomly-shaped chips 1-4mm x 2-20 mm x 0.2-3 mm; (3) are dimensionally stabilised and treated with antiseptic before dispersing in (2); wt. ratio (3):(2) is such that the exposed surface of wood chips is 10-90 % of the total surface of (1): (1) is 1-2mm thick; (1) is bonded with (4) at 130-150 deg.C and 1-3 MPa for 10-60 mins; (4) consists of many prepreg sheets, each produced by impregnating a base plate with a curable resin; prepreg base is glass; polyamide or polyester fibre or a non-woven glass paper, acrylic fibre or vinylon fibre material; (4) is 0.3-2mm thick; final bonding is carried out by laying up (7) with (5) and another prepreg sheet, then heating under pressure, pref. at 100-120 deg.C and 0.1MPa for 1-3 mins; (7) is 15-30 mm thick; pref. the process also includes polishing the surface of the laminated sheet and coating it with a layer of transparent synthetic resin.

USE/ADVANTAGE - (I) is useful for the surface decoration of furniture, domestic articles, automobile fittings, etc. and

INT-CL (IPC): H01B 7/02; H01F 5/06; H01F 27/32

ABSTRACTED-PUB-NO: JP55145308A

BASIC-ABSTRACT:

A coil element is mfd. by winding an insulated wire comprising a heat-resisting enamelled wire wound with non-woven fabric having a density of 0.2 to 0.7 g/cc. The coil element is impregnated with heat-resisting resin in vacuum and heated to cure resin.

The heat-resisting enamel is heat-resisting polyester, heat-resisting epoxy, polyester imide, polyamide imide, polyimide, or polyhydantoin. The non-woven fabric consists of polyester or aromatic polyamide. The heat-resisting resin is epoxy or imide resin.

UV-curable putty is coated on both ends of a coil element and cured thereon. The coil element is impregnated with ultraviolet -curable resin contg. no filler in vacuum. The impregnated coil element is irradiated with ultraviolet rays and heated to make a resin-moulded coil.

This resin-moulded coil has stable electrical characteristics for a long period of time.
